

J.W. TOWNSEND
LANDSCAPES

Congratulations on your new containers!

If you have a maintenance agreement with us, we will handle the watering of your containers.

If not, you should check your new containers 2-3 times a week for their water needs depending on the environmental locations. Container gardens that are located in hot, sunny, or windy locations will need to be watered more frequently than those located in shaded or protected areas.

You can use a moisture meter available from any garden or hardware center and follow the enclosed instructions for usage. You can also use your index finger by inserting it into soil up to your second knuckle; if the soil is dry, you need to water until you can see the seepage under your pot.

Enjoy your container garden and please let us know if you have any questions!
